Jamstack reflection   u24580482

Using JAMstack was an interesting experience for me. What we were told to use was Nuxt 3, with which I built a responsive and modern webpage that includes dynamic content which fetches from 2 different APIs. This displayed how powerful a disengaged web approach may be. Using APIs made the page feel more engaging without having to use a backend server. A problem that I had faced was making sense of how data is fetched from Nuxt works, especially when it came to the asynchronous composables and how it affects the rendering. I learnt how form handling without a server simplifies contact form submissions, even though I did find it a bit hard when setting up Netlify forms. I saw first hand how JAMstack improves maintenance, speed and scalability.
